

Method and system for report selection in a system that provides a plurality of reports. A database is populated with selected data elements of a plurality of data types, and a database content table is created that indicates the data types of the data elements present in the database. For each report, a report identifier and an associated set of report requirements are established in a report table. Each set of report requirements identifies a set of data types required for the associated report. A set of report identifiers is output for the data types of data elements in the database that satisfy the associated sets of report requirements.
